AGILE USER STORIES

Bank Loan Application System (BLAS)

Document Reference	BLAS-AGS-2025-003
Version	1.0 — Final
Prepared By	Business Analysis Team
Total Stories	10 User Stories
Total Story Points	76 Points
Sprint Coverage	Sprints 1–7 Phases 1–2
Classification	CONFIDENTIAL — Internal
Date	May 2025

1. Introduction & Backlog Overview

This document presents 10 detailed Agile User Stories for the Bank Loan Application System (BLAS) project at Sunrise Private Bank Ltd. Each user story follows the standard Agile format ('As a [user], I want to [action] so that [benefit]') and is enriched with comprehensive acceptance criteria, story point estimates, sprint allocation, dependencies, and a Definition of Done.

These stories form part of the BLAS Product Backlog and are intended for use in Sprint Planning, Development, and User Acceptance Testing (UAT). They should be read in conjunction with the Business Requirements Document (BLAS-BRD-2025-001) and the Use Case Specification Document (BLAS-UCS-2025-002).

1.1 Story Point Scale (Modified Fibonacci)

1 Point	2 Points	3 Points	5 Points	8 Points	13 Points
Trivial	Extra Small	Small	Medium	Large	Extra Large

1.2 Role Colour Legend

Customer	Loan Officer	Bank Manager	Credit Underwriter	Compliance Officer
----------	--------------	--------------	--------------------	--------------------

1.3 Product Backlog Summary

ID	Title	Role	Epic	Priority	Sprint	Pts
US-001	Online Loan Application Submission	Customer	Loan Origination	High	Sprint 1	8
US-002	Real-Time Application Status Tracking	Customer	Customer Self-Service	High	Sprint 2	5
US-003	Document Upload with OCR Auto-Population	Customer	Document Management	High	Sprint 1	8
US-004	Loan Application Queue Management	Loan Officer	Loan Officer Workflow	High	Sprint 2	5
US-005	Digital KYC Verification via Video Call	Loan Officer	Document Management	High	Sprint 3	8
US-006	Automated Credit Scorecard Assessment	Credit Underwriter	Credit Assessment Engine	High	Sprint 4	13
US-007	Multi-Level Loan Approval Workflow	Bank Manager	Approval Workflow	High	Sprint 5	8
US-008	Sanction Letter Generation and eSign	Loan Officer	Document Generation	High	Sprint 5	5
US-009	Portfolio Health and MIS Dashboard	Bank Manager	Reporting, MIS	Medium	Sprint 6	8
US-010	Regulatory Compliance Reporting	Compliance Officer	Reporting, MIS	Medium	Sprint 7	8

Priority Breakdown	Points by Priority	Stories by Role
High: 8 stories (US-001 to US-008) Medium: 2 stories (US-009, US-010) Low: 0 stories	High Priority: 60 points Medium Priority: 16 points Total Backlog: 76 story points	Customer: 3 stories Loan Officer: 3 stories Bank Manager: 2 stories Credit Underwriter: 1 story Compliance Officer: 1 story

2. User Story Specifications

Each story is presented in a structured card format. The Acceptance Criteria (AC-01, AC-02, etc.) are written as testable 'Given–When–Then' or outcome-based statements. The Definition of Done applies to all stories in addition to story-specific acceptance criteria.

2.1 US-001 — Online Loan Application Submission

US-001 Online Loan Application Submission		
USER STORY <i>"As a Customer, I want to submit a loan application online through a step-by-step guided form so that I can apply for a loan from anywhere at any time without visiting a branch."</i>		
ROLE Customer	PRIORITY □ High	STORY POINTS 8 Points (Large)
Epic	Loan Origination & Application Capture	
Sprint / Phase	Sprint 1 — Phase 1 Core Platform	
Description	Customers need a seamless, mobile-friendly, multi-step loan application form that guides them through product selection, personal details, income information, document upload, and final submission. The form must auto-save progress and generate a unique Application Reference Number (ARN) upon submission.	
Acceptance Criteria	AC-01 Given the customer visits the BLAS portal and selects a loan product, when they begin the application, then a multi-step form (minimum 4 steps: Product, Personal Details, Financial Details, Documents) is presented with a clear progress indicator showing the current and remaining steps. AC-02 Given the customer has partially completed the application, when they close the browser or navigate away, then the entered data is auto-saved every 3 minutes, and upon return the customer can resume from the last completed step using their ARN or registered login. AC-03 Given the customer has completed all mandatory fields and uploaded all required documents, when they click 'Submit Application', then a unique ARN is generated within 5 seconds, displayed on-screen, and sent to the customer's registered mobile number via SMS and email within 5 minutes. AC-04 Given the customer attempts to submit the form with one or more mandatory fields empty, when they click 'Submit', then the system highlights all missing fields with a red border and a descriptive inline error message (e.g., 'Date of birth is required'), and the submission is blocked until all mandatory fields are complete.	

	AC-05 Given the customer accesses the portal on a mobile device (screen width 375px or above), then all form fields, buttons, upload controls, and navigation elements must render correctly and be fully functional without horizontal scrolling.
Definition of Done	• Code reviewed, unit tested with minimum 80% coverage, and merged to the main branch. • All 5 acceptance criteria pass in the UAT environment with documented test evidence. • Application form is accessible and passes WCAG 2.1 Level AA automated scan. • Performance test confirms form page loads within 2 seconds at P95 under 2,000 concurrent users. • Product Owner sign-off obtained on the completed story in the Sprint Review.
Dependencies	US-002 (PAN Verification API must be integrated before final submission validation). Product catalogue API must return active loan products.
Notes / Constraints	File upload limits: max 5 MB per file, formats: PDF, JPG, PNG. Application must expire and be deleted after 30 days of inactivity per data retention policy.

2.2 US-002 — Real-Time Application Status Tracking

US-002 Real-Time Application Status Tracking		
USER STORY <i>"As a Customer, I want to track the real-time status of my loan application at every stage so that I can stay informed about progress and know exactly what actions I need to take."</i>		
ROLE Customer	PRIORITY □ High	STORY POINTS 5 Points (Medium)
Epic	Customer Self-Service & Notifications	
Sprint / Phase	Sprint 2 — Phase 1 Core Platform	
Description	Customers should be able to view a visual, stage-by-stage status tracker for their application at any time using only their ARN and registered mobile number, without requiring a full login. The tracker must show the current stage, completion history with timestamps, pending actions, and estimated next update dates. Automated notifications must fire at every stage transition.	
Acceptance Criteria	AC-01 Given a customer enters a valid ARN and their registered mobile number on the tracking page, when they click 'Track', then the system displays a visual progress bar showing all application stages (Submitted → KYC → Credit Assessment → Approval → Disbursed), with the current active stage highlighted and all completed stages marked with a green tick and completion timestamp. AC-02 Given the customer's application transitions to a new stage (e.g., from 'KYC Pending' to 'Credit Assessment'), when the transition is recorded in the system, then an SMS and email notification is automatically dispatched within 5 minutes, containing the new stage name, a brief explanation of what happens next, and the tracking portal URL. AC-03 Given a customer action is required (e.g., uploading an additional document or responding to a Request for Additional Information), when the customer views the tracker, then a prominently displayed action banner appears in red with the specific action required, the deadline date, and a direct link to the upload/action portal. AC-04 Given a customer enters an ARN that does not exist or a mobile number that does not match the ARN, when they click 'Track', then the system displays a generic error message ('The details entered do not match our records') and does not reveal any application information. AC-05 Given the customer has a sanctioned loan, when they access the tracker, then they can download the Sanction Letter and MITC document in PDF format after authenticating with a one-time OTP sent to their registered mobile number.	

Definition of Done	• Status tracker page passes ARN + mobile validation logic with documented unit tests. • All 5 acceptance criteria pass in UAT with screenshots as evidence. • Notification delivery tested with mock SMS gateway; delivery rate above 98% confirmed. • Sensitive credit data (bureau score, decline reasons) confirmed absent from customer-facing tracker. • Page load time under 1.5 seconds confirmed in performance test at P95.
Dependencies	US-001 (ARN must exist before tracking is possible). Notification Service (SMS Gateway, SMTP) must be configured. Stage workflow engine must be operational.
Notes / Constraints	Customer must not be able to view credit scores, bureau details, or internal underwriter notes on this page. Per TRAI DLT regulations, all SMS templates must be pre-registered before sprint go-live.

2.3 US-003 — Document Upload with OCR Auto-Population

US-003 Document Upload with OCR Auto-Population		
USER STORY <i>"As a Customer, I want to upload my KYC and income documents and have the system automatically extract key information from them so that I can avoid repetitive manual data entry and reduce errors in my application."</i>		
ROLE Customer	PRIORITY ☐ High	STORY POINTS 8 Points (Large)
Epic	Document Management & KYC	
Sprint / Phase	Sprint 1 — Phase 1 Core Platform	
Description	The system must support digital document upload with an intelligent OCR engine that auto-extracts key data fields (name, address, income, account number, employer name) from standard document types (Aadhaar, PAN card, salary slips, ITR, bank statements) and pre-populates the corresponding application fields. Discrepancies between extracted data and entered data must be flagged for customer review.	
Acceptance Criteria	AC-01 Given a customer uploads a clear scan of their PAN card (PDF or image format), when the OCR engine processes the document, then the applicant's name, date of birth, and PAN number are automatically extracted and pre-populated into the corresponding application fields within 10 seconds, and a 'Data Extracted — Please Verify' banner is shown to the customer. AC-02 Given a customer uploads a document that is blurry, incomplete, password-protected, or of an unsupported type, when the system attempts OCR processing, then the document is rejected, a specific error message is displayed (e.g., 'This document appears blurry. Please upload a higher resolution scan of at least 200 DPI'), and the customer can retry the upload up to 5 times. AC-03 Given the OCR engine extracts a value that differs from a field the customer has already manually entered (e.g., extracted name 'Priya Sharma' vs entered name 'Priya S'), when the discrepancy is detected, then the conflicting field is highlighted in amber with a tooltip showing both values, and the customer is required to explicitly confirm or correct the value before proceeding. AC-04 Given a customer uploads a 6-month bank statement, when the OCR engine processes it, then the average monthly credit (salary/income) and the average month-end balance are extracted and displayed as indicative income data for the customer's review, along with the detected bank name and account number (last 4 digits only).	

	AC-05 Given all documents in the upload checklist have been uploaded and accepted (either by OCR or manual flagging override), when the customer clicks 'Proceed to Next Step', then the document checklist is marked complete, the customer cannot re-upload already-accepted documents without raising a query, and the application advances to the next step.
Definition of Done	• OCR accuracy tested against a sample of 50 documents per type; minimum 92% field extraction accuracy achieved and documented. • Supported document types and file constraints (5 MB, PDF/JPG/PNG) are enforced and tested. • All 5 acceptance criteria pass in UAT. • Data privacy review confirms no raw Aadhaar data is stored in plain text; UIDAI masking applied. • OCR processing time under 10 seconds confirmed for standard documents at normal server load.
Dependencies	Document Management System (DMS) must be provisioned and accessible. OCR engine vendor API (e.g., AWS Textract or in-house) must be integrated and tested.
Notes / Constraints	Aadhaar number must be stored in masked form only (last 4 digits visible) per UIDAI circular. OCR extraction is an assistive feature — all extracted data must be customer-confirmed before submission.

2.4 US-004 — Loan Application Queue Management

US-004 Loan Application Queue Management		
USER STORY <i>"As a Loan Officer, I want to view and manage all loan applications assigned to me in a prioritised queue dashboard so that I can efficiently process applications in order of urgency, SLA status, and completeness."</i>		
ROLE Loan Officer	PRIORITY ☐ High	STORY POINTS 5 Points (Medium)
Epic	Loan Officer Workflow & Productivity	
Sprint / Phase	Sprint 2 — Phase 1 Core Platform	
Description	Loan Officers need a dedicated work queue dashboard that aggregates all applications assigned to them, with real-time filtering, sorting, and prioritisation capabilities. The queue must visually flag SLA status (On-Track, At-Risk, Breached), highlight applications with pending customer actions, and enable officers to take direct actions (open application, send reminders, raise queries) from the dashboard without navigating away.	
Acceptance Criteria	AC-01 Given a Loan Officer logs into BLAS, when they navigate to their dashboard, then a work queue is displayed showing all assigned applications with the following columns visible: ARN, Customer Name (masked — first name + last initial), Product Type, Application Date, Current Stage, SLA Status (colour-coded: Green = On-Track, Amber = At-Risk, Red = Breached), and Next Action Required. AC-02 Given the Loan Officer's queue contains applications, when they use the filter panel, then they can filter by: Product Type, Application Stage, SLA Status, Date Range, and Priority Flag; and results update within 1 second without a full page reload. AC-03 Given an application has breached its SLA timer, when the Loan Officer views their queue, then the application row is highlighted in red, the SLA Breached column shows the number of hours/days past the deadline, and the Loan Officer's supervisor automatically receives an email notification about the breach. AC-04 Given a customer has not responded to a Request for Additional Information (RAI) for more than 3 business days, when the Loan Officer views the application in the queue, then a 'Send Reminder' button is available; clicking it dispatches a pre-configured reminder SMS and email to the customer and logs the outreach attempt in the application's communication history. AC-05 Given the Loan Officer selects an application from the queue and opens it, when they view the application detail page, then all sections are available (KYC status, uploaded documents with preview,	

	credit assessment status, communication log, and audit trail), and they can navigate between sections using a sticky sidebar menu without losing their scroll position.
Definition of Done	- Queue dashboard renders all required columns and filters; unit and integration tests pass. - SLA timer logic tested with mock data covering all three SLA states (On-Track, At-Risk, Breached). - Supervisor escalation email tested in staging with confirmed delivery. - All 5 acceptance criteria pass in UAT with documented Loan Officer sign-off. - Dashboard page load under 2 seconds with 500 applications in queue confirmed in performance test.
Dependencies	SLA configuration module must be set up with product-specific SLA timers. Role-Based Access Control (RBAC) must be configured so officers only see applications in their assigned branch/region.
Notes / Constraints	Customer PII (full name, phone number, email) must be masked in the queue view per DPDPA 2023 data minimisation principles. Full details only visible when an application is opened directly.

2.5 US-005 — Digital KYC Verification via Video Call

US-005 Digital KYC Verification via Video Call		
USER STORY <i>"As a Loan Officer (certified V-CIP official), I want to conduct a compliant Video KYC session with the customer directly within the BLAS platform so that I can verify the customer's identity digitally without requiring them to visit a branch."</i>		
ROLE Loan Officer	PRIORITY ☐ High	STORY POINTS 8 Points (Large)
Epic	Document Management & KYC	
Sprint / Phase	Sprint 3 — Phase 1 Core Platform	
Description	The system must provide an embedded, RBI-compliant Video Customer Identification Process (V-CIP) module. The module must enable a certified Loan Officer to schedule, initiate, and conduct a secure video call with the customer, perform liveness verification, capture a live photograph, verify original identity documents shown on camera, record verbal consent, and complete the V-CIP checklist — all within a single integrated interface.	
Acceptance Criteria	AC-01 Given the Loan Officer initiates a VKYC session for an application, when the customer joins the session link, then the system establishes a peer-to-peer encrypted video connection (minimum 720p resolution) within 10 seconds, and both parties can see and hear each other clearly with no audio-video sync delay above 500ms. AC-02 Given the VKYC session is active, when the Loan Officer runs the liveness check, then the system prompts the customer to perform a random challenge (e.g., 'Please blink twice', 'Please turn your head left') and the system automatically captures a live photograph when the liveness challenge is successfully completed, attaching it to the KYC record. AC-03 Given the VKYC session is active, when the Loan Officer completes all checklist items (liveness verified, original ID document captured on camera, verbal consent recorded, geo-tag confirmed), then all items must be individually checked off and the 'Complete VKYC' button only becomes enabled when the entire checklist is complete. AC-04 Given a VKYC session is completed with all checklist items confirmed, when the officer clicks 'Complete VKYC', then the full session video (minimum quality: 720p) is automatically encrypted (AES-256), stored in the DMS with the ARN reference, assigned a retention period of 5 years, and the KYC status on the application is updated to 'Verified — VKYC' within 30 seconds. AC-05 Given a VKYC session drops due to network interruption (connection loss for more than 60	

	seconds), when the connection is lost, then the session is automatically paused and saved, the customer receives a link to rejoin within 24 hours, and the partially completed session data is preserved so the officer does not need to restart the checklist from the beginning.
Definition of Done	• VKYC module tested in staging environment with real video calls across Chrome, Firefox, and Safari. • Session recording, encryption, and DMS storage end-to-end flow tested and passed. • V-CIP checklist logic verified: 'Complete VKYC' button confirmed disabled until all items are checked. • All 5 acceptance criteria pass in UAT with RBI compliance checklist signed off by Compliance Officer. • Network interruption handling tested with simulated connection drops; session resume confirmed.
Dependencies	WebRTC-based video infrastructure must be provisioned. DMS must support encrypted video storage. Officer must have active V-CIP certification flag in the system (user profile attribute). Geo-tagging API must be integrated.
Notes / Constraints	RBI V-CIP guidelines require the session to be geo-tagged and time-stamped. The officer conducting V-CIP must be an employee of the Bank (not an outsourced agent). Session recordings are subject to 5-year mandatory retention per RBI directive.

2.6 US-006 — Automated Credit Scorecard Assessment

US-006 Automated Credit Scorecard Assessment		
USER STORY <i>"As a Credit Underwriter, I want the system to automatically pull credit bureau reports and compute a composite credit score for each applicant so that I can make faster, more consistent, and fully documented credit decisions."</i>		
ROLE Credit Underwriter	PRIORITY ☐ High	STORY POINTS 13 Points (Extra Large)
Epic	Credit Assessment Engine	
Sprint / Phase	Sprint 4 — Phase 1 Core Platform	
Description	Upon KYC completion, the system must automatically query all four RBI-licensed credit bureaus (CIBIL, Experian, Equifax, CRIF), consolidate the results, and run the Bank's configured credit scorecard to compute a composite credit score and credit grade (A–E). The output must include a structured Credit Assessment Report (CAR) pre-populated with all data points, enabling the underwriter to review, add commentary, and submit their recommendation without manually re-keying any bureau data.	
Acceptance Criteria	AC-01 Given the application status transitions to 'Credit Assessment Pending', when the system initiates the bureau pull, then all four bureau APIs (CIBIL, Experian, Equifax, CRIF) are queried simultaneously (in parallel, not sequentially), the responses are received and stored within 10 seconds under normal conditions, and each bureau's transaction reference ID is recorded against the application for audit and cost tracking. AC-02 Given all bureau responses are received, when the credit scorecard engine runs, then it computes a composite credit score (0–100 scale) broken down into five components: (i) Bureau Score Component, (ii) Income & Employment Stability, (iii) Leverage & FOIR, (iv) Product-Specific Risk, and (v) Relationship Score — and maps the composite score to a credit grade (A: 80–100, B: 65–79, C: 50–64, D: 35–49, E: below 35), all displayed in a visual score breakdown chart. AC-03 Given the credit grade is E (composite score below 35), when the scorecard engine completes, then the system automatically sets the application status to 'Auto-Declined', populates the standardised RBI Fair Practices Code decline reason codes, and no manual override of this auto-decline is possible without explicit written approval from the Head of Retail Credit (recorded as a system override log). AC-04 Given policy deviation flags are triggered (e.g., FOIR above 65% for a salaried applicant, loan amount above 10x annual income), when the Underwriter	

	opens the Credit Assessment Report, then each policy deviation is displayed in a clearly labelled amber warning box with the specific rule breached, the customer's actual value vs the policy threshold, and a mandatory 'Deviation Justification' text field that must be completed before the CAR can be submitted. AC-05 Given the Underwriter has reviewed the pre-populated CAR and added their commentary and recommendation, when they click 'Submit CAR', then the CAR is locked from further edits (read-only for the Underwriter), digitally timestamped with the Underwriter's User ID, stored in the DMS, and the application is automatically routed to the appropriate approval authority based on the loan amount and credit grade (as per the configured authority matrix).
Definition of Done	• Parallel bureau API calls tested; confirmed all four queries fire simultaneously and results consolidated correctly. • Scorecard calculation validated against 20 test cases covering all five grade bands. • Auto-decline logic for Grade E tested and override prevention confirmed. • CAR lock-on-submit and read-only state tested; no edits possible after submission. • All 5 acceptance criteria pass in UAT with Credit Risk team sign-off on scorecard parameters. • Performance tested: scorecard computation within 2 minutes of bureau data receipt confirmed.
Dependencies	Bureau API credentials and contracts must be in place for all four bureaus. Credit Policy Rules must be formally documented and approved by the CRO before scorecard configuration. Authority Matrix must be configured in the approval workflow engine.
Notes / Constraints	Scorecard parameters (weights, thresholds) must be configurable by the Credit Risk team via an admin console without code deployment. All bureau inquiry logs must be retained for 7 years per RBI record-keeping guidelines.

2.7 US-007 — Multi-Level Loan Approval Workflow

US-007 Multi-Level Loan Approval Workflow		
USER STORY <i>"As a Bank Manager, I want to review loan applications escalated to my approval level and record my decisions with full justification within the system so that all credit approvals are traceable, policy-compliant, and completed within mandated SLA timelines."</i>		
ROLE Bank Manager	PRIORITY ☐ High	STORY POINTS 8 Points (Large)
Epic	Approval Workflow & Governance	
Sprint / Phase	Sprint 5 — Phase 1 Core Platform	
Description	The system must enforce a configurable multi-level approval workflow where loan applications are automatically routed to the correct approving authority based on loan amount, product type, and credit grade. Branch Managers, Credit Managers, and Credit Committee members must be able to review, approve, conditionally approve, or reject applications with mandatory justification, within a maker-checker framework that prevents the same officer from both underwriting and approving a loan.	
Acceptance Criteria	AC-01 Given a loan application has a completed CAR and is in 'Pending Approval' status, when the system routes it to the Bank Manager's approval queue, then the routing decision is based entirely on the pre-configured Authority Matrix (e.g., loans up to INR 50 Lakh → Branch Manager, INR 50 Lakh to INR 2 Crore → Zonal Credit Manager, above INR 2 Crore → Credit Committee), and the Bank Manager can only see and action applications within their delegated authority limit — attempts to approve an application exceeding their limit are blocked by the system. AC-02 Given the Bank Manager opens an application for review, when they navigate the approval interface, then they can access: the complete Credit Assessment Report (CAR), all bureau reports, KYC documents, uploaded financial documents, and the full application audit trail — all within the same screen without requiring a separate login to another system. AC-03 Given the Bank Manager decides to approve the loan, when they click 'Approve', then they must select an approval decision type (Full Approval or Conditional Approval) and for Conditional Approval, must enter at least one condition with a compliance deadline; the 'Approve' button only activates after all mandatory fields are completed, and the decision is recorded with timestamp, officer ID, and IP address in the immutable audit log. AC-04 Given the Bank Manager is the approving authority and has already reviewed the application, when they attempt to approve an application where	

	their own User ID is recorded as the Credit Underwriter (i.e., they underwrote the same loan), then the system blocks the approval action, displays the message 'You cannot approve an application you have underwritten (Maker-Checker policy)', and automatically notifies the next-level approver to take action. AC-05 Given a loan approval request has been sitting in the Bank Manager's queue and its SLA timer has reached 75% of the permitted approval window, when this threshold is crossed, then the Bank Manager receives an automated email and in-system notification warning of the imminent breach; at 100% SLA breach, the application is auto-escalated to the next authority level and the Bank Manager's supervisor is notified.
Definition of Done	• Authority Matrix routing logic tested with 10 loan amount scenarios across all configured authority tiers. • Maker-Checker enforcement tested: underwriter-as-approver block confirmed for same-user IDs. • SLA escalation logic tested: 75% warning and 100% breach escalation both trigger correct notifications. • Conditional Approval flow tested end-to-end: condition creation, tracking, fulfillment, and final sanction. • Audit log entries verified for every approval action: timestamp, user ID, IP, and decision recorded. • All 5 acceptance criteria pass in UAT with Bank Manager and Compliance Officer sign-off.
Dependencies	Authority Matrix must be configured in the system by the Credit Policy team before sprint testing. RBAC roles for Branch Manager, Zonal Credit Manager, and Credit Committee must be defined. SLA timer configuration for approval stages must be set up.
Notes / Constraints	The 4-eyes / maker-checker principle is a hard system control — it cannot be overridden by any officer regardless of seniority. All approval decisions are immutable once confirmed: no edits or deletions permitted on approval records.

2.8 US-008 — Sanction Letter Generation and eSign

US-008 Sanction Letter Generation and eSign		
USER STORY <i>"As a Loan Officer, I want the system to automatically generate a personalised sanction letter and dispatch it to the customer for digital signature so that loan documentation is completed quickly, accurately, and without any manual paperwork."</i>		
ROLE Loan Officer	PRIORITY □ High	STORY POINTS 5 Points (Medium)
Epic	Document Generation & Legal	
Sprint / Phase	Sprint 5 — Phase 1 Core Platform	
Description	Upon final credit approval, the system must auto-generate a personalised Sanction Letter and MITC (Most Important Terms and Conditions) document using approved legal templates, populate all applicant-specific and sanction-specific fields, have the approving officer's digital signature affixed via the eSign service, and dispatch it to the customer for counter-signature with a time-bound acceptance link.	
Acceptance Criteria	AC-01 Given a loan application receives a final 'Approved' decision, when the approval is confirmed, then the system automatically generates the Sanction Letter and MITC document within 2 minutes using the correct product-specific legal template, with all fields (applicant name, loan amount, interest rate, tenure, EMI, processing fee, prepayment terms, conditions precedent) correctly populated from the application's approved sanction data — no blank or placeholder fields may remain. AC-02 Given the Sanction Letter is auto-generated, when the system submits it to the eSign service (eMudhra / Sify API), then the approving officer's Digital Signature Certificate (DSC) is affixed to the document, the signed document is returned within 10 seconds, and the original unsigned and signed versions are both stored in the DMS with version labels and a tamper-evident hash. AC-03 Given the signed Sanction Letter is ready, when the system dispatches the customer acceptance package, then the customer receives an email containing: (a) the signed Sanction Letter as a PDF attachment, (b) a secure eSign acceptance link with a clearly stated 15-day expiry date, and (c) the MITC document; and simultaneously, an SMS is sent with the acceptance link and expiry date. AC-04 Given the customer opens the eSign acceptance link and reviews the Sanction Letter, when they click 'I Accept and Sign', then the system triggers an Aadhaar OTP-based eSign process, the customer's digital signature is affixed to the document, the counter-signed document is stored in the DMS, and the application status is updated to	

	'Sanctioned — Customer Accepted' within 30 seconds of successful eSign. AC-05 Given the customer has not clicked the acceptance link within 12 days of dispatch (3 days before the 15-day deadline), when this threshold is reached, then the system automatically sends a final reminder SMS and email to the customer stating 'Your loan sanction expires in 3 days. Please sign your Sanction Letter at [link] to proceed.'
Definition of Done	- Sanction Letter template rendering tested across all 8 active loan products with no blank fields in any scenario. - eSign API integration tested end-to-end: DSC affixation by officer and Aadhaar OTP eSign by customer both pass in staging. - DMS storage tested: both unsigned and signed versions stored with correct version labels and hash. 15-day expiry and 12-day reminder logic tested with mock clock in QA environment. - All 5 acceptance criteria pass in UAT with Legal team confirming document content compliance with RBI Fair Practices Code.
Dependencies	eSign service provider (eMudhra / Sify) API integration must be completed and credentials configured. Legal team must approve all Sanction Letter templates before they are loaded into the system. UIDAI eSign API must be available for customer counter-signature.
Notes / Constraints	All generated documents must be stored in DMS with a 10-year retention policy per RBI record-keeping guidelines. The Sanction Letter is a legally binding document and must not be modified after officer eSign is applied.

2.9 US-009 — Portfolio Health and MIS Dashboard

US-009 Portfolio Health and MIS Dashboard		
USER STORY <i>"As a Bank Manager, I want to view a real-time MIS dashboard showing my branch's loan portfolio performance, SLA compliance, and disbursement metrics so that I can proactively manage the team's productivity and identify bottlenecks."</i>		
ROLE Bank Manager	PRIORITY ☐ Medium	STORY POINTS 8 Points (Large)
Epic	Reporting, MIS & Analytics	
Sprint / Phase	Sprint 6 — Phase 2	
Description	The Bank Manager needs an interactive, role-specific MIS dashboard that aggregates live data across all branch loan applications and the active portfolio. The dashboard must display key metrics including pipeline by stage and product, daily/weekly/monthly sanctions and disbursements, SLA compliance rates, TAT analysis, Early Warning Signal (EWS) flags, and team productivity metrics — all with drill-down capability and export to Excel/PDF.	
Acceptance Criteria	AC-01 Given the Bank Manager logs into BLAS and navigates to the Manager Dashboard, when the page loads, then the following KPI tiles are displayed and reflect data updated within the last 4 hours: (i) Total Active Applications in Branch Pipeline, (ii) Applications at SLA Risk / Breached (with count), (iii) Sanctions This Month (count and value in INR), (iv) Disbursements This Month (count and value in INR), (v) SLA Compliance Rate % for the current month. AC-02 Given the Bank Manager clicks on any KPI tile or chart element, when the drill-down is activated, then a detailed data table is displayed showing the individual application records contributing to that metric, with columns for ARN, Customer Name, Product, Stage, Officer Assigned, and SLA Status — and the table must be sortable by any column. AC-03 Given the Manager Dashboard is displayed, when the Bank Manager selects a date range filter (Today, This Week, This Month, Custom Range), then all charts and KPI tiles on the dashboard update within 2 seconds to reflect data for the selected period without a full page reload. AC-04 Given the Bank Manager wants to export a performance report, when they click 'Export', then they can choose between PDF (formatted summary report) and Excel (raw data with all columns) formats, and the downloaded file is generated within 30 seconds and contains data matching exactly what is displayed on the dashboard at the time of export. AC-05 Given one or more active loan accounts in the branch portfolio are flagged by the Early Warning Signal (EWS) engine (e.g., missed EMI, NACH	

	bounce, deteriorating bureau score), when the Bank Manager views the dashboard, then a dedicated 'EWS Alerts' section displays the flagged accounts with signal type, severity (Level 1 / Level 2 / Level 3), days since first signal, and a direct link to the account's detail page.
Definition of Done	• Dashboard renders all KPI tiles with correct values validated against database queries. • Drill-down table functionality tested for all KPI tiles; sort functionality on all columns confirmed. • Date range filter tested: all widgets update within 2 seconds. • Export tested: PDF and Excel outputs match on-screen data exactly for 3 different date ranges. • EWS section tested with mock flagged accounts; severity levels display correctly. • All 5 acceptance criteria pass in UAT with Bank Manager sign-off.
Dependencies	EWS engine (US phase 2) must be operational to populate the EWS Alerts section. Data aggregation pipeline must run at minimum every 4 hours. Role-based access control must restrict managers to data from their assigned branch(es) only.
Notes / Constraints	Dashboard must only display branch-level data for the logged-in manager. Zonal-level views are a separate dashboard for Zonal Managers (out of scope for this story). All exports are logged in the audit trail per data access policy.

2.10 US-010 — Regulatory Compliance Reporting

US-010 Regulatory Compliance Reporting		
USER STORY <i>"As a Compliance Officer, I want the system to automatically generate and package all required regulatory reports and submissions so that the Bank fulfils its statutory obligations accurately and on time without manual data compilation."</i>		
ROLE Compliance Officer	PRIORITY □ Medium	STORY POINTS 8 Points (Large)
Epic	Reporting, MIS & Analytics	
Sprint / Phase	Sprint 7 — Phase 2	
Description	The Compliance Officer needs BLAS to automatically generate, validate, and package all mandatory regulatory submissions — including CRILC reports (RBI), SMA classification, CERSAI security interest filings, CKYC uploads, and Fair Practices Code compliance logs — in the exact prescribed formats. The system must support scheduled batch generation, manual on-demand generation, and an automated pre-submission validation that flags data quality errors before filing.	
Acceptance Criteria	AC-01 Given the monthly CRILC (Central Repository of Information on Large Credits) report is due (10th of each month for all borrowers with aggregate exposure above INR 5 Crore), when the scheduled batch job runs on the 8th of each month at 6:00 AM IST, then the system automatically generates the CRILC report in the RBI-prescribed XML format, populates it with all qualifying borrower exposure data from the portfolio, and places it in the Compliance Officer's submission queue with a 'Pending Review' status. AC-02 Given the CRILC report has been auto-generated and is in the submission queue, when the Compliance Officer opens it for review, then a pre-submission validation summary is displayed showing: total records included, any records failing RBI format validation (e.g., missing CIN for corporate borrowers, exposure below reporting threshold incorrectly included), and a count of records with data quality warnings — with the option to view and resolve each error before submission. AC-03 Given SMA (Special Mention Account) classification is required for all loan accounts, when the daily SMA classification batch runs at 12:00 AM IST, then the system automatically classifies all accounts as Standard, SMA-0 (1–30 DPD), SMA-1 (31–60 DPD), or SMA-2 (61–90 DPD) based on CBS repayment data, updates the classification in the portfolio module, and generates an SMA movement report (accounts upgraded and downgraded since last run) for the Compliance Officer's review each morning.	

	AC-04 Given a new mortgage loan is disbursed (home loan or secured MSME loan), when the disbursement is confirmed in the system, then a CERSAI security interest registration request is automatically prepared, pre-populated with the required fields (borrower details, property description, charge type, charge amount), and presented to the Compliance Officer for review and submission initiation — this must occur within 1 working day of disbursement to comply with the 30-day CERSAI registration deadline. AC-05 Given a regulatory reporting format is updated by RBI or another authority (signalled by a configuration change in the report template admin), when the updated template is published by the IT team, then all subsequent report generation uses the new format, previously generated reports in the old format are archived with a 'Legacy Format' tag, and the Compliance Officer receives an in-system notification confirming the template update with the effective date.
Definition of Done	• CRILC batch job tested: fires at correct time, generates valid XML per RBI schema, records are correctly filtered. • Pre-submission validation tested: known error cases (missing CIN, wrong format) correctly flagged. • SMA classification logic tested against 15 account scenarios covering all DPD bands and edge cases. • CERSAI request auto-preparation tested for home loan and MSME secured loan disbursements. • Template update notification tested with a mock template version change. • All 5 acceptance criteria pass in UAT with Compliance Officer and Internal Auditor sign-off.
Dependencies	CBS (Finacle) must provide daily repayment data feed for SMA classification. CERSAI web service API credentials must be provisioned. RBI CRILC submission portal API or SFTP credentials must be available for automated filing. Legal/Compliance team must confirm and approve all report formats before sprint coding begins.
Notes / Constraints	Report submissions to RBI are a legal obligation. Any failure in automated generation must trigger an immediate escalation alert to the Compliance Officer, CTO, and CEO. All submitted reports must be archived for a minimum 7 years per RBI record-keeping guidelines.

3. Sprint Allocation Roadmap

The table below shows the recommended sprint allocation for these 10 user stories based on technical dependency order, business priority, and estimated team velocity of 20–25 story points per 2-week sprint.

Sprint	Phase	Stories	Focus Area	Total Pts	Duration
Sprint 1	Phase 1	US-001, US-003	Application Submission + Document OCR	16 pts	2 weeks
Sprint 2	Phase 1	US-002, US-004	Status Tracking + Loan Officer Queue	10 pts	2 weeks
Sprint 3	Phase 1	US-005	Digital VKYC Module	8 pts	2 weeks
Sprint 4	Phase 1	US-006	Credit Scorecard Engine	13 pts	2 weeks
Sprint 5	Phase 1	US-007, US-008	Approval Workflow + Sanction Letter	13 pts	2 weeks
Sprint 6	Phase 2	US-009	Manager MIS Dashboard	8 pts	2 weeks
Sprint 7	Phase 2	US-010	Regulatory Compliance Reporting	8 pts	2 weeks

4. Document Approval

Role	Name & Signature	Date
Business Analyst Lead	Ms. Priya Sharma Sign: _____	_____
Product Owner	Ms. Deepa Krishnan Sign: _____	_____
Technology Lead	Mr. Anand Mehta Sign: _____	_____
QA Manager	Mr. Rohit Kapoor Sign: _____	_____
Scrum Master	Mr. Vikram Joshi Sign: _____	_____
